5 Game Theory

5.1 Points to be noted [14 lines]

>[First Write a Brute Force solution]
>Nim = all xor
>Misere Nim = Nim + corner case: if all piles are 1, reverse(nim)
>Bogus Nim = Nim
>Staircase Nim = Odd indexed pile Nim (Even indexed pile doesn't matter, as one player can give bogus moves to drop all even piles to ground)
>Sprague Grundy: [Every impartial game under the normal play convention is equivalent to a one-heap game of nim]
Every tree = one nim pile = tree root value; tree leaf value = 0; tree node value = mex of all child nodes.
[Careful: one tree node can become multiple new tree roots(multiple elements in one node), then the value of that node = xor of all those root values]
>Hackenbush(Given a rooted tree; cut an edge in one move; subtree under that edge gets removed; last player to cut wins):
Colon:
 $\text{G}(u) = (\text{G}(v_1)+1) \oplus (\text{G}(v_2)+1) \oplus \dots [v_1, v_2, \dots \text{are children of } u]$
For multiple trees ans is their xor
>Hackenbush on graph (instead of tree given an rooted graph):
fusion: All edges in a cycle can be fused to get a tree structure; build a super node, connect some single nodes with that super node, number of single nodes is the number of edges in the cycle.
Sol: [Bridge component tree] mark all bridges, a group of edges that are not bridges, becomes one component and contributes number of edges to the hackenbush. (even number of edges contributes 0, odd number of edges contributes 1)

10.2 Bitset C++ [18 lines]

```
bitset<17>BS;
BS[1] = BS[7] = 1;
cout<<BS._Find_first()<<endl; // prints 1
bs._Find_next(idx). This function returns
first set bit after index idx. for example:
bitset<17>BS;
BS[1] = BS[7] = 1;
cout<<BS._Find_next(1)<<','<<BS._Find_next(3) ]
<<endl; // prints 7,7
So this code will print all of the set bits of
BS:

for(int i=BS._Find_first();i< BS.size();i =
    BS._Find_next(i))
    cout<<i<<endl;
//Note that there isn't any set bit after idx,
BS._Find_next(idx) will return BS.size();
same as calling BS._Find_first() when
bitset is clear;
b[i], b.test(i)
b.set(), b.set(i), b.set(i, val)
b.reset(), b.reset(i)
b.flip(), b.flip(i)
b.count(), b.size(), b.any(), b.none(),
    b.all()
b.to_ulong(), b.to_ullong(), b.to_string()
```

    return z;
}
```

13 Random

13.1 Combinatorics

- $\sum_{k=0}^n \binom{n-k}{k} = Fib_{n+1}$
- $\binom{n}{k} + \binom{n}{k+1} = \binom{n+1}{k+1}$
- $k\binom{n}{k} = n\binom{n-1}{k-1}$
- Number of binary sequences of length n such that no two 0's are adjacent = Fib_{n+1}
- Number of non-negative solution of $x_1 + x_2 + x_3 + \dots + x_k = n$ is $\binom{n+k-1}{n}$

13.1.1 Catalan Number

- $C_n = \frac{1}{n+1} \binom{2n}{n} = \binom{2n}{n} - \binom{2n}{n+1} = \frac{(2n)!}{(n+1)!n!}$
- $C_0 = 1, C_1 = 1, C_n = \sum_{k=0}^{n-1} C_k C_{n-1-k}$
- 1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862, 16796, 58786
- Number of correct bracket sequences consisting of n opening brackets.
- Number of ways to completely parenthesize $n+1$ factors.
- The number of triangulations of a convex polygon with $+2$ sides (i.e. the number of partitions of polygon into disjoint triangles by using the diagonals).

- The number of ways to connect the $2n$ points on a circle to form n disjoint i.e. non-intersecting chords.
- The number of monotonic lattice paths from point $(0,0)$ to point (n,n) in a square lattice of size $n \times n$, which do not pass above the main diagonal

- Number of permutation of length n that can be stack sorted.
- The number of non-crossing partitions of a set of n elements.
- The number of rooted full binary tree with $n+1$ leaves.
- The number of Dyck words of length $2n$. A string consisting of n X's and n Y's such that no string prefix has more Y's than X's.

- Number of permutation of length n with no three-term increasing subsequence.

- Number of ways to tile a staircase shape of height n with n rectangle.

- $C_n^k = \frac{k+1}{n+1} \binom{2n-k}{n-k}$ denote the number of bracket sequences of size $2n$ with the first k elements being (.

- $N(n, k) = \frac{1}{n} \binom{n}{k} \binom{n}{k-1}$

- The number of expressions containing n pairs of correct parentheses, which contain k distinct nestings. $N(4, 2) = 6$

- The number of paths from $(0,0)$ to $(2n, 0)$ with steps only northeast and southeast, not staying below the x-axis with k peaks. And sum of all number of peaks is Catalan number.

13.1.2 Stirling Number of the First Kind

- Count permutation according to their number of cycles.
- $S(n, k)$ count the number of permutation of n elements with k disjoint cycles.
- $S(n, k) = (n-1) \times S(n-1, k) + S(n-1, k-1), S(0, 0) = 1, S(n, 0) = S(0, n) = 0$
- $S(n, 1) = (n-1)!$
- $S(n, n-1) = \binom{n}{2}$
- $\sum_{k=0}^n S(n, k) = n!$

13.1.3 Stirling Numbers of the Second Kind

- Number of ways to partition a set of n objects into k non-empty subsets.
- $S(n, k) = k * S(n-1, k) + S(n-1, k-1)$, $S(0, 0) = 1$, $S(n, 0) = S(0, n) = 0$
- $S(n, 2) = 2^{n-1} - 1$
- $S(n, k) = \frac{1}{k!} \sum_{j=0}^k (-1)^{k-j} \binom{k}{j} j^n$
- $S(n, k) * k!$ = number of ways to color n nodes using colors from 1 to k such that each color is used at least once.

13.1.4 Bell Number

- Counts the number of partitions of a set.
- $B_{n+1} = \sum_{k=0}^n \binom{n}{k} * B_k$
- $B_n = \sum_{k=0}^n S(n, k)$, where S is Stirling number of second kind.
- The number of multiplicative partitions of a square free number with i prime factors is the i-th Bell number.
- $B(p^m + n) \equiv mB(n) + B(n+1) \pmod{p}$
- If a deck is shuffled by removing and reinserting the top card n times, there are n^n possible shuffles. The number of shuffles that return the deck to its original order is B_n , so the probability of returning to the original order is B_n/n^n .

13.1.5 Lucas Theorem

- If p is prime then $\binom{p^a}{k} \equiv 0 \pmod{p}$
- For non-negative integers m and n and a prime p:

$$\binom{m}{n} = \prod_{i=0}^k \binom{m_i}{n_i} \pmod{p}$$
 where
 $m = m_k p^k + m_{k-1} p^{k-1} + \dots + m_1 p + m_0$
 $n = n_k p^k + n_{k-1} p^{k-1} + \dots + n_1 p + n_0$ are the base p expansion.

13.1.6 Derangement

- A permutation such that no element appears in its original position.
- $d(n) = (n-1) * (d(n-1) + d(n-2))$, $d(0) = 1$, $d(1) = 0$
- $d(n) = n! (n-1)! + (-1)^n = \lfloor \frac{n!}{e} \rfloor$, $n \geq 1$

13.1.7 Burnside Lemma

Given a group G of symmetries and a set X, the number of elements of X up to symmetry equals

$$\frac{1}{|G|} \sum_{g \in G} |X^g|$$

where X^g are the elements fixed by g ($g.x = x$). If f(n) counts "configurations" of some sort of length n, we can ignore rotational symmetry using $G = \mathbb{Z}_n$ to get

$$g(n) = \frac{1}{n} \sum_{k=0}^{n-1} f(\gcd(n, k)) = \frac{1}{n} \sum_{k|n} f(k) \phi(n/k)$$

13.1.8 Eulerian Number

- $E(n, k)$ is the number of permutations of the numbers 1 to n in which exactly k elements are greater than the previous element.
- $E(n, k) = (n-k)E(n-1, k-1) + (k+1)E(n-1, k)$, $E(n, 0) = E(n, n-1) = 1$
- $E(n, k) = \sum_{j=0}^k (-1)^j \binom{n+1}{j} (k+1-j)^n$
- $E(n, k) = E(n, n-1-k)$
- $E(0, k) = [k=0]$
- $E(n, 1) = 2^n - n - 1$

13.2 Number Theory

13.2.1 Möbius Function and Inversion

- define $\mu(n)$ as the sum of the primitive nth roots of unity depending on the factorization of n into prime factors:

$$\mu(x) = \begin{cases} 0 & \text{n is not square free} \\ 1 & \text{n has even number of prime factors} \\ -1 & \text{n has odd number of prime factors} \end{cases}$$

- Möbius Inversion:

$$g(n) = \sum_{d|n} f(d) \Leftrightarrow f(n) = \sum_{d|n} \mu(d) g(n/d)$$

$$\sum_{d|n} \mu(d) = [n = 1]$$

$$\bullet \phi(n) = \sum_{d|n} \mu(d) \cdot \frac{n}{d} = n \sum_{d|n} \frac{\mu(d)}{d} = \sum_{d|n} d \cdot \mu\left(\frac{n}{d}\right)$$

$$\bullet a|b \rightarrow \phi(a)|\phi(b)$$

$$\bullet \phi(mn) = \phi(m) \cdot \phi(n) \cdot \frac{d}{\phi(d)}$$
 where $d = \gcd(m, n)$

$$\bullet \phi(n^m) = n^{m-1} \phi(n)$$

$$\bullet \sum_{i=1}^n [\gcd(i, n) = k] = \phi\left(\frac{n}{k}\right)$$

$$\bullet \sum_{i=1}^n \gcd(i, n) = \sum_{d|n} d \cdot \phi\left(\frac{n}{d}\right)$$

$$\bullet \sum_{i=1}^n \frac{1}{\gcd(i, n)} = \sum_{d|n} \frac{1}{d} \cdot \phi\left(\frac{n}{d}\right) = \frac{1}{n} \sum_{d|n} d \cdot \phi(d)$$

$$\bullet \sum_{i=1}^n \frac{i}{\gcd(i, n)} = \frac{n}{2} \cdot \sum_{d|n} \frac{1}{d} \cdot \phi\left(\frac{n}{d}\right) = \frac{n}{2} \cdot \frac{1}{n} \sum_{d|n} d \cdot \phi(d)$$

$$\bullet \sum_{i=1}^n \frac{n}{\gcd(i, n)} = 2 \cdot \sum_{i=1}^n \frac{i}{\gcd(i, n)} - 1$$

13.2.2 GCD and LCM

- $\gcd(a, b) = \gcd(b, a \bmod b)$
- If $a|b.c$, and $\gcd(a, b) = d$, then $(a/d)|c$.
- GCD is a multiplicative function.
- $\gcd(a, \text{lcm}(b, c)) = \text{lcm}(\gcd(a, b), \gcd(a, c))$
- $\gcd(n^a - 1, n^b - 1) = n^{\gcd(a, b)} - 1$

13.2.3 Gauss Circle Theorem

- Determine the number of lattice points in a circle centered at the origin with radius r.
- number of pairs (m, n) such that $m^2 + n^2 \leq r^2$
- $N(r) = 1 + 4 \sum_{i=0}^{\infty} (\lfloor \frac{r^2}{4i+1} \rfloor - \lfloor \frac{r^2}{4i+3} \rfloor)$

13.2.4 Pick's Theorem

According to Pick's Theorem We can calculate the area of any polygon by just counting the number of Interior and Boundary lattice points of that polygon. If number of interior points are I and number of boundary lattice points are B then Area (A) of polygon will be:

$$Area = I + B/2 - 1$$

where I is the number of points in the interior shape, B stands for the number of points on the boundary of the shape.

13.2.5 Formula Cheatsheet

- $\sum_{i=1}^n = \frac{1}{m+1} [(n+1)^{m+1} - 1 - \sum_{i=1}^n (1^{m+1} - i^{m+1} - (m+1)i^m)]$
- $\sum_{i=0}^n c^i = \frac{c^{n+1}-1}{c-1}$, $c \neq 1$

- $\sum_{i=1}^n i^3 = \left(\frac{n(n+1)}{2}\right)^2$

13.2.6 3D Geometry

- Distance between points $A(x_1, y_1, z_1)$ and $B(x_2, y_2, z_2)$:
$$\frac{|AB|}{\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}}$$
- Angle between vectors \vec{u} and \vec{v} :
$$\cos \theta = \frac{\vec{u} \cdot \vec{v}}{\|\vec{u}\| \|\vec{v}\|}$$
- Area of triangle with edge vectors \vec{u}, \vec{v} :
$$\frac{1}{2} \|\vec{u} \times \vec{v}\|$$
- Volume of parallelepiped with generators $\vec{u}, \vec{v}, \vec{w}$:
$$V = |\vec{u} \cdot (\vec{v} \times \vec{w})|$$
- Distance from point $P(x_0, y_0, z_0)$ to plane $ax + by + cz + d = 0$:
$$\frac{|ax_0 + by_0 + cz_0 + d|}{\sqrt{a^2 + b^2 + c^2}}$$
- Plane through three points A, B, C : $\vec{n} = \overrightarrow{AB} \times \overrightarrow{AC}$, equation $\vec{n} \cdot (\vec{r} - \vec{r}_A) = 0$
- Plane from point $P_0(x_0, y_0, z_0)$ and normal $\vec{n} = (a, b, c)$: $a(x - x_0) + b(y - y_0) + c(z - z_0) = 0$
- Distance between parallel planes $ax + by + cz + d_1 = 0$ and $ax + by + cz + d_2 = 0$:
$$\frac{|d_1 - d_2|}{\sqrt{a^2 + b^2 + c^2}}$$
- Distance from point P to line through A with direction \vec{d} :
$$\frac{\|\overrightarrow{AP} \times \vec{d}\|}{\|\vec{d}\|}$$
- Shortest distance between skew lines $L_1 : \vec{r} = \vec{a}_1 + s\vec{d}_1$ and $L_2 : \vec{r} = \vec{a}_2 + t\vec{d}_2$:
$$\frac{|(\vec{a}_2 - \vec{a}_1) \cdot (\vec{d}_1 \times \vec{d}_2)|}{\|\vec{d}_1 \times \vec{d}_2\|}$$
- Line through two points $A(x_1, y_1, z_1)$ and $B(x_2, y_2, z_2)$:
$$\frac{x - x_1}{x_2 - x_1} = \frac{y - y_1}{y_2 - y_1} = \frac{z - z_1}{z_2 - z_1}$$
- Plane through $A(x_1, y_1, z_1), B(x_2, y_2, z_2), C(x_3, y_3, z_3)$:

$$\begin{vmatrix} x - x_1 & y - y_1 & z - z_1 \\ x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ x_3 - x_1 & y_3 - y_1 & z_3 - z_1 \end{vmatrix} = 0$$
- Coplanarity of A, B, C, D :

$$\begin{vmatrix} x_A & y_A & z_A & 1 \\ x_B & y_B & z_B & 1 \\ x_C & y_C & z_C & 1 \\ x_D & y_D & z_D & 1 \end{vmatrix} = 0$$

• Plane intercept form cutting axes at a, b, c : $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$

• Angle between two planes with normals \vec{n}_1, \vec{n}_2 :
$$\cos \theta = \frac{|\vec{n}_1 \cdot \vec{n}_2|}{\|\vec{n}_1\| \|\vec{n}_2\|}$$

• Line-plane intersection for line $\vec{p} = \vec{p}_0 + t\vec{d}$ and plane $ax + by + cz + d = 0$:
$$t = -\frac{ax_0 + by_0 + cz_0 + d}{ad_x + bd_y + cd_z}$$
 when denominator non-zero

• Parametric line from point $P_0(x_0, y_0, z_0)$ with direction (a, b, c) : $x = x_0 + at, y = y_0 + bt, z = z_0 + ct$

• Line with direction ratios (l, m, n) through P_0 : symmetric form $\frac{x - x_0}{l} = \frac{y - y_0}{m} = \frac{z - z_0}{n}$; direction cosines $(\cos \alpha, \cos \beta, \cos \gamma)$ satisfy $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$

• Angle between line with direction ratios (l, m, n) and plane $ax + by + cz + d = 0$:
$$\sin \theta = \frac{|al + bm + cn|}{\sqrt{l^2 + m^2 + n^2} \sqrt{a^2 + b^2 + c^2}}$$

• Midpoint of segment joining $A(x_1, y_1, z_1)$ and $B(x_2, y_2, z_2)$:
$$M\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}, \frac{z_1 + z_2}{2}\right)$$

• Centroid of triangle with vertices A, B, C :
$$G\left(\frac{x_A + x_B + x_C}{3}, \frac{y_A + y_B + y_C}{3}, \frac{z_A + z_B + z_C}{3}\right)$$

• Centroid of tetrahedron with vertices A, B, C, D :
$$\left(\frac{x_A + x_B + x_C + x_D}{4}, \frac{y_A + y_B + y_C + y_D}{4}, \frac{z_A + z_B + z_C + z_D}{4}\right)$$

• Sphere of radius r : surface $S = 4\pi r^2$, volume $V = \frac{4}{3}\pi r^3$

• Right circular cone (radius r , height h):
$$V = \frac{1}{3}\pi r^2 h$$
, lateral area $\pi r \sqrt{r^2 + h^2}$
